EC Declaration of Conformity

The manufacturer: INOXPA, S.A.
c/ Telers, 57
17820 Banyoles (Girona), Spain

herewith declares that the machine:

RF Flexible impeller pump

with the serial number: ____________

conforms to the relevant provisions of the following directives:

- Low voltage Directive 2006/95/EC

Applicable harmonised Standards:

- UNE-EN ISO 12100:2012

Identification of the person empowered to draw up the Declaration on behalf of the manufacturer, and qualified to compile the technical file established by the Community:

Banyoles, 23 September 2015

David Reyero Brunet
Technical Office Manager
1. Safety

1.1. INSTRUCTIONS MANUAL
This manual contains information about the reception, installation, operation, assembly, disassembly and maintenance of the RF pump. The information provided in this Instructions Manual is based on updated facts. INOXPA reserves the right to modify this Instruction Manual without prior notice.

1.2. START-UP INSTRUCTIONS
This Instructions Manual contains vital and useful information for properly operating and maintaining your pump. Read carefully these instructions before starting up the pump; become familiar with the operation and use of your pump and follow the instructions closely. It is very important that a copy of these Instructions is kept in a set place near the plant.

1.3. SAFETY
1.3.1. Warning signs

- General danger of injury
- Electrical hazard
- Danger! Suspended load
- Compulsory requirement to ensure safety at work
- Danger of injuries caused by the rotary parts of the equipment
- Danger! Caustics or etching materials
- Danger of equipment malfunction
- Use of goggles is compulsory

1.4. GENERAL SAFETY INSTRUCTIONS
Read carefully this Instructions Manual before installing the pump and starting it up. If in doubt, contact INOXPA.

1.4.1. During installation

Always observe the Technical Specification given in Chapter 8.
Never start up the pump before it has been connected to the piping.

Do not start up the pump before it has been installed.

Check that the motor specifications are the required ones, especially when working under conditions that involve the risk of explosion.

During the installation of the pump, all the electrical work must be carried out by an authorized operative.

1.4.2. During operation

Always observe the Technical Specification given in Chapter 8. NEVER exceed the limit of the specified values.

NEVER touch the pump or the pipes during operation when the pump is being used to decant hot fluids or when it is being cleaned.
The pump contains moving parts. Never introduce your fingers into the pump while the pump is in operation.

NEVER operate the pump with the inlet and discharge valves closed.

NEVER clean the electrical motor with water. The standard protection of the motor is IP-55: Protection against dust and spraying water.

1.4.3. During maintenance

Always observe the Technical Specification given in Chapter 8.

NEVER disassemble the pump before the pipes have been emptied. Remember that some of the fluid will always remain in the pump casing (when no drainage is provided). Note that the pumped fluid may be dangerous or very hot. Please refer to the regulations applicable in the respective country.

Do not leave detached parts on the floor.

ALWAYS disconnect the pump from the power before beginning the maintenance. Remove the fuses and disconnect the cables from the motor terminals.

All the electrical work must be carried out by an authorized operative.

1.4.4. Compliance with the instructions

Any failure to comply with the instructions might entail risks to the operators, the environment and the equipment, and result in the loss of the right to claim for damages.

Such non-compliance might entail the following risks:

- Failure of important functions of the equipment / plant.
- Failure of specific maintenance and repair procedures.
- Threat of electrical, mechanical and chemical risks.
- Environmental risks caused by the release of substances.

1.4.5. Warranty

Any warranty provided shall immediately and ipso jure become void, and INOXPA shall be indemnified against any product liability claim from third parties, if:

- the service and maintenance work was not carried out in accordance to the service instructions, or the repair work has not been carried out by our personnel or it has been carried without our written authorization;
- our materials have been changed without prior written authorization;
- the parts or lubricants used are not original INOXPA parts and products;
- the materials were used improperly or carelessly, or not in accordance to these instructions and their intended use;
- pump parts were damaged by strong pressure for lack of a safety valve.

The General Delivery Terms already furnished to you also apply.

No change can be made to the equipment without prior discussion with the manufacturer. For your safety, please use original spare parts and accessories. The use of other parts will release the manufacturer from any liability.

The service terms can only be changed with prior written authorisation from INOXPA.

When in doubt, or if you would like more detailed information on specific matters (adjustment, assembly, disassembly, etc.), please do not hesitate to contact us.

3. General information

3.1. DESCRIPTION
Flexible-impeller pumps are part of INOXPA’s rotary pumps range. Their basic structure consists in a microfusion casing manufactured in AISI 316L and an rubber impeller. The other parts in contact with pumped material are also made of AISI 316L. The pumps of the RF series are available both in monoblock version with direct motor at 1500 rpm and in bareshaft configuration; optionally, they can also be supplied mounted on a stainless-steel or iron trolley. The standard sealing is mechanical seal in graphite / ceramic with EPDM gaskets. The standard connections are DN 11851 adaptors.

The design of the RF pumps makes them suitable for handling both low- and high-viscosity fluids, especially those containing solid particles, air, or gases in general. It should be noted that these pumps are self-priming and reversible.

This equipment is suitable for his use in food process.

3.2. OPERATING PRINCIPLE
The operation of the pump can be seen in the following figure:

- The special contour of the casing makes the volume of the cavities formed between the casing and the blades increase progressively. Thus, the fluid is forced to flow into the casing.
- The continuous rotation of the impeller transports the chambers filled with fluid from the suction side to the discharge nozzle.
- In the discharge area, the volume of the cavities decreases smoothly, thereby expelling the fluid into the facility.
- From this principle of operation, it can be seen that these are reversible pumps; i.e., by changing the direction of rotation of the impeller, the direction of pumping can be inverted.

3.3. RANGE OF APPLICATION
900 r.p.m.
The range of application for each type of pump is limited. The pump was selected for a given set of pumping conditions when the order was placed. INOXPA shall not be liable for any damage resulting from the incompleteness of the information provided by the purchaser (nature of the fluid, RPM, etc.).
4. Installation

4.1. RECEPTION OF THE PUMP

INOXPA cannot be held responsible for the damage sustained by the equipment during transport or unpacking. Please visually check that the packaging is not damaged.

The pump package includes the following documents:
- Dispatch sheets.
- Instruction and Service Manual of the pump.
- Instruction and Service Manual of the motor (*)
  (*) when the pump is supplied with an motor by INOXPA.

Unpack the pump and check the following:

- The suction and discharge connections of the pump, removing any rest of packaging materials.
- The pump and the motor are not damaged.
- If the equipment is not in good condition and/or any part is missing, the carrier should report accordingly as soon as possible.

4.1.1. Identification of the pump

![Pump plate]

**Serial number**

4.2. HANDLING AND STORAGE

RF pumps are often too heavy to be handled and stored manually.

Lift the pump as shown below:
4.3. LOCATION
Place the pump as close as possible to the suction tank, and if possible below the fluid level.
Place the pump so as to allow around it space enough to access the pump and the motor. (See Chapter 8 Technical Specifications for dimensions and weight).
Mount the pump on a flat, level surface.
The foundation must be rigid, horizontal, level and vibration-proof.

![Warning]
Install the pump so as to allow proper ventilation.
If the pump is installed outdoors, it should be covered by a roof. Its location should allow easy access for inspection or maintenance operations.

4.4. PIPES
- As general rule, fit the suction and discharge pipes in straight sections, with the least possible number of bends and accessories in order to reduce as much as possible any loss of load caused by friction.
- Ensure that the nozzles of the pump are properly aligned to the pipe and their diameter is similar to that of the pump connections.
- Place the pump as close as possible to the suction tank, if possible below the fluid level, or even below the tank, so that the manometric head of the static suction is highest.
- Place pipe supports as close as possible to the suction and discharge nozzles of the pump.

4.4.1. Cut-off valves
The pump can be isolated for maintenance purposes. To such end, cut-off valves must be fitted to the suction and discharge nozzles of the pump.
The valves must ALWAYS be open during operation of the pump.

4.5. ELECTRIC WIRING

![Warning]
The connection of the electrical motors must be performed by a qualified operative.
Take all necessary precautions to prevent the failure of connections and cables.

![Warning]
The electrical equipment, the terminals and the components of the control systems may still bear electrical current when powered off. Contact with them may be dangerous for operators or cause irreversible damage to equipment.

Before handling the pump, make sure that the switchboard is not powered on.

- Connect the motor following the manufacturer’s instructions.
- Check the direction of rotation.

Start the pump motor briefly. Ensure the pumping direction is the right one. If the pump operates in the wrong direction it may cause severe damage.

![Warning]
ALWAYS check the direction of rotation of motor with fluid inside de pump.

For models with a seal chamber, ALWAYS ensure that the chamber is full of fluid before checking the direction of rotation.
5. Start-up

Before starting the pump, carefully read the instructions given in Chapter 4. *Installation.*

5.1. START-UP

Read Chapter 8 *Technical Specification* carefully. INOXPA cannot be held responsible for the improper use of the equipment.

NEVER touch the pump or the pipes when hot fluid is being pumped.

5.1.1. Checks before starting up the pump

- Fully open the cut-off valves on the suction and discharge pipes.
- If the fluid does not flow into the pump, fill the pump with fluid.

The pump must NEVER rotate without fluid inside it.

- Check that the direction of rotation of motor is the right one.

5.1.2. Checks when starting up the pump

- Check whether the pump makes strange sounds.
- Check whether the absolute inlet pressure is enough to avoid cavitation in the pump. See the curve to determine the minimum pressure required above steam pressure (NPSHr).
- Control discharge pressure.
- Check that there are no leaks through the sealed areas.

A cut-off valve on the suction pipe must no be used to regulate flow. Cut-off valves must be fully open during operation.

Control motor consumption to avoid power overload.

Reduce flow and motor power consumption by reducing motor speed.

In order to prevent to work over the desing pressure, avoiding damaging the pump and having fast wear of the rotor, a flow by-pass is needed.
6. Operating problems

The following table provides solutions to problems that might arise during the operation of the pump. The pump is assumed to have been properly installed and be suitable for the relevant application. Please contact INOXPA if technical assistance is required.

If the problem persists, use of the pump must cease immediately. Contact the pump’s manufacturers or their representative.
7. Maintenance

7.1. GENERAL
Like any other machine, this pump requires maintenance. The instructions included in this manual cover the identification and replacement of spare parts. These instructions are intended for the maintenance personnel and those responsible for the supply of spare parts.

Please carefully read Chapter 8 Technical Specification.

All replaced materials must be disposed of /recycled in accordance to the applicable local regulations.

ALWAYS disconnect the pump from the power before performing the maintenance.

7.1.1. Check the mechanical seal
Regularly check that there are no leaks in the shaft area. If there are leaks through the mechanical seal, replace it following the instructions given under the Disassembly and Assembly section.

7.2. STORAGE
The pump must be completely emptied of fluid before storage. If possible, avoid exposing the components of the pump to excessively humid environments.

Flexible impellers must be stored in a dry place protected from direct sunlight.

Remove the impeller when the pump will not be used for a long time.

7.3. CLEANING

The use of aggressive cleaning products, such as caustic soda and nitric acid, can cause skin burns.

Use rubber gloves during cleaning procedures.

Always use protective goggles.

7.3.1. Automatic CIP (cleaning-in-place)
If the pump is installed in a system with a CIP process, it is not necessary to disassemble the pump.
If the automatic cleaning process is not provided, proceed to disassemble the pump as indicated in the Disassembly and Assembly section.

**Cleaning solutions for CIP processes**

Use only clear water (without chlorides) for mixing with the cleaning agents:

**a) Alkaline solution:** 1% in weight of caustic soda (NaOH) at 70°C (150°F)

1 Kg NaOH + 100 l. water = cleaning solution
or
2.2 l. NaOH at 33% + 100 l. water = cleaning solution

**b) Acid solution:** 0.5% in weight of nitric acid (HNO₃) at 70°C (150°F)

0.7 liters HNO₃ at 53% + 100 l. water = cleaning solution
Control the concentration of the cleaning solutions to avoid deterioration of the pump seals.

To remove the remaining cleaning products, ALWAYS perform a final rinse with clean water on completion of the cleaning process.

7.3.2. Automatic SIP (sterilization-in-place)
The process of sterilization with steam is applied to all the equipment including the pump.

Do NOT start the equipment during the process of sterilization with steam.
The parts/materials suffer no damage if the indications specified in this manual are observed.

No cold liquid can enter the equipment till the temperature of the equipment is lower than 60°C (140°F).

A flow by-pass is recommended to be used in order to assure the flow of sterile product after the pump.

<table>

7.4. DISASSEMBLY / ASSEMBLY OF THE PUMP

7.4.1. Pump casing, impeller and mechanical seal

吸入 Disassembly
Loosen the blind nuts (45) and detach the pump cover (03). Then, pull out the casing (01) together with the impeller (02). Remove the stationary part of the mechanical seal (08), the O-ring (80) and the tie bars (29) from the casing. Finally, remove the rotary part of the seal (08) and the splash ring (82) from the shaft.

吸入 Assembly
Slide the splash ring (82) over the shaft (05), but do not push it to the end. Slide the rotary part of the seal (05/05A) to the stop. Insert the impeller (02) and the stationary part of the seal (08) into the casing (01). Gently fit all the assembly into the lantern (04), or the ball bearing (06) for the bareshaft pump. Place the O-ring (80) on the casing (01) and fasten the tie bars (29). Mount the cover (03) and fasten it all with the blind nuts (45).

CAUTION! When mounting the new seal, plunge the parts and seals in soapy water to facilitate sliding of both the stationary and the rotary parts.
Before the impeller (02) is mounted, it should be lubricated with grease. For food-processing applications, use health-safe grease.

Insert the impeller (01) into the casing (01) and rotate it in the direction of rotation.

7.4.2. Change of drive (monoblock pump)

**Disassembly**
Loosen and remove the hexagonal screws (52) and the washers (53). Remove the lantern (04) from the motor (93). Remove the pin (56) that makes the motor shaft and the pump shaft rotate in conjunction. Finally, remove the shaft (05B).

**Assembly**
Drill a hole in the drive shaft according to the dimension shown in the figure below. Mount the pump shaft (05B) to the motor shaft. Insert the pin (56) through the shaft. Mount the lantern (04) to the motor flange (93) and fasten it with the hexagonal screws (52) and the washers (53).

7.4.3. Change of bearings (bareshaft pump)

**Disassembly**
Remove the bearings support (06), the seal (88) and the elastic ring (66). Pull out the assembly formed by the shaft (05), bearings (70), elastic ring (66A) and stop ring (31). Remove the elastic ring (66A) and the ring (31). Finally, remove the bearings (70A) and the spacer bushing (17).

**Assembly**
Mount the bearings (70A) and the spacer bushing (17) to the shaft (05). Place the stop ring (31) and attach it using the elastic ring (66A). Mount the assembly to the bearings support (06) and attach it using the elastic ring (66).
7.4.4. Disassembly of the flushing seal

**Disassembly**
First disassemble the pump casing and the impeller as in 7.4.1. Gently remove the flushing cover (10), which will now be placed on the lantern (04), or the ball bearing (06) for the bareshaft pump. Finally, remove the stainless steel spring seal (88B) and the (80A) from the lantern.

**Assembly**
Mount the seal (8B) and the O-ring (80) to the flushing cover (10), and taking care not to damage the seal (88B), mount the assembly to the lantern (04), or the ball bearing (06) for the bareshaft pump.

7.4.5. Disassembly of the double seal cover

**Disassembly**
First disassemble the pump casing and the impeller as in 7.4.1. The double seal cover (09) will now be placed on the body (01). Loosen the Allen screws (51) and detach the double seal cover (09). Remove the two stainless steel spring seals (08B), the spacer bushing (17B) and the O-ring (80B) from the double seal cover.

**Assembly**
Mount the seals (08B) separated by the bushing (17) to the double seal cover (09A), and place also the O-ring (80B) into its housing. Fit the assembly into the casing (01) and fasten with the Allen screws (51). Finally, mount the assembly to the lantern (04) or the support (06), taking care not to damage the seals (08B).

## 8.3. BEARINGS MAINTENANCE

The bareshaft pump RF bearings are permanently greased bearings, so no lubrication maintenance is required. Under normal working duties, they must be changed after 15,000 working hours.

Regarding motor bearings shall be carried out in accordance with the manufacturer’s instructions.
